ABSTRACT OF THE DISCLOSURE

A hand-held optical scanning device has a body gripped between distal and proximal ends thereof. An optical scanner disposed therein is arranged to scan objects in a direction which is outward from the distal end. A first resilient member is located at the distal end and forms a first
10 resting surface. A second resilient member is located at the proximal end and forms a second resting surface for the device, as well as either an eyelet or hook for supporting the device.
